Java Technology

Practical List

Last updated on 17/01/2019

Lab	Aim	Hours
1	Introduction to Netbeans IDE and JDBC	2
	1. Create a Java application consisting of the following components:	
	a. Student class with private data members: int id, String name, double cpi. Default	
	constructor, parameterized constructor, getter-setter methods and toString method.	
	b. DemoStudent class has main method to create various Student objects	
	Using command-line-argument This is a fine-argument.	
	Taking input from user at runtime 2. While the state of the stat	
	2. Write a Java application to fetch student registration information (like firstName, lastName, branch, username and password) from database using JDBC. (Using Statement object)	
2	Working with JDBC and Servlets	2
	1. Write a Java application to fetch records of student registration and practice the use of the following methods of ResultSet interface: absolute(), afterLast(), beforeFirst(), first(), isFirst(), isLast(), last(), previous(), next(), relative()	
	2. Write a servlet that displays a hello message on the browser.	
3	Working with Servlets	2
	Write a servlet to display the initialization (servlet and context) parameters.	
	2. Write a servlet to display the request headers.	
	3. Write a servlet which registers and displays the number of hits made by clients since that servlet has been deployed.	
4	Working with Servlets (delegating the request) and JSP	2
	1. Write a Java web application for a login module which contains the following components:	
	index.html: for getting input from the user.	
	 ValidateServlet.java: a servlet class for validating the user. If it is a valid user (validate from database using PreparedStatement), it will forward the request to the welcome servlet. If user is not validated then it displays Error message along with the response from index.html. 	
	WelcomeServlet.java: a servlet class for displaying the welcome message.	
	Validate Serviet	
	Name Password	
	No Is Yes Include National Include Natio	
	Index.html	
	Sorry username or password error ! Name Password Login	
	Write a Java web application to search a word or phrase on Google search engine. The application should have following components:	
	 Search.html: It contains a textbox to accept search word or phrase from user. 	
	 Search.num. It contains a textbox to accept search word of phrase from user. SearchOnGoogleServlet.java: It should redirect the search query to Google search en- 	
	gine.	
	3. Write a Java web application to demonstrate usage of JSP Scripting Elements (Scriptlet, Expression, Delaration) and JSP implicit objects (out, request, response.)	
	Use method post to submit a feedback form (html) (Full Name, Email, Subject, Message)to a jsp page and let jsp page preview the same as confirmation page with additional text "Feedback received. Thank you.".	
5	1. Write a web based Java application which allows the user to download a file from the list of available files. The application has two components as follow:	2
	• FileList.html: It displays a list of files to the user to choose a file to download.	
	• FileDownloadServlet: It takes the user's choice for a file to be downloaded and sends that file in response to the user.	
	2. Given a design goal below, write a web based application using the following standard actions: jsp:useBean (with attributes:'id', 'scope', 'type', and 'class'), jsp:getProperty to display final results.	

Components identified as follow.: Movie.java, **Genre.html**, **ControllerServlet** and **Display-MovieList.jsp**

- **Movie.java** provides a bean/class data members, accessors, mutators, toString, default and parameterized constructor as required.
- **Genre.html** provides a list of movie genres to the user to choose from. Send the chosen genre as request parameter to ControllerServlet.
- **ControllerServlet** contains a list of movies according to genre. Set a request scope attribute "mymovies" with the array of movies of the chosen genre. Forward the request to DisplayMovieList.jsp
- **DisplayMovieList.jsp** displays the names of movies by getting them from the attribute "mymovies".
